CC genomic sample of DNA. The sample is treated chemically to convert CC CDNA that contains the target C is amplified to form a labeled amplicon. CC DNA that contains the target C is amplified to form a labeled amplicon. CC The amplicon is hybridisacton to both classes, each with at least one CC and the degree of hybridisaction to both classes is determined from the CC and the degree of hybridisaction to both classes is determined from the CC classes of oligomers, the degree of methylation is calculated. The method CC is used: (i) for diagnosis and/or prognosis of side effects of the rapeutic drugs and of a wide range of diseases, e.g. cancer, disorders CC of the central nervous, cardiovascular, gastrointestinal and respiratory contypes and for investigating cell differentiation. The method acceptable in the contypes and for investigating cell differentiation. The method allows the contypes and for investigating cell differentiation. The method allows the CC methylation status of many C residues to be determined simultaneously. CC ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the CC method for determining the degree of cytosine methylation described in CC the disclosure of the invention.

                                                                                                                                The invention relates to a method for producing a mammalian islet cell. The method comprising introducing into a mammalian cell a nucleic acid molecule encoding an islet transcription factor for expression of the islet transcription factor in the cell and for production of islet cell phenotype in the cell. The islet transcription factor is a neuroendocrine basic helix-loop-helix (bHLH) transcription factor. The method is useful for treating type 2 diabetes mellitus and for replacing beta cells lost to autroimmune destruction in individuals with type 1 diabetes. The method is useful in cell therapy. The present sequence is human neurogenin 1 (Ngn1) gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bonaldo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured mRNa was size fractionated on a 1% agarose
gel. First strand cDNA synthesis was primed with an
oligo-dT primer containing a Not I site. Double stranded
cDNA was size selected according to mRNA size fraction,
ligated with EcoR I adaptor, digested with Not I, and then
cloned directionally into pYX-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
is TGAGAGAGCC. This library was created for the
University of Iowa Mouse Brain Molecular Anatomy Project
(BMAP): 'Gene Discovery in the Developing Mouse Nervous
System', supported by National Instututes of Mental Health
(NINMI), Hemin Chin, Ph.D., program coordinator."
